KOROGARD 500 MB Protective Wallcovering with Antimicrobial Product Protection

KOROGARD Protective Wallcovering is available with the option of antimicrobial protection — an additive that continuously fights the growth and spread of microbes such as odor and stain causing bacteria, mold and mildew.

What is antimicrobial product protection?

Antimicrobial protection is an additive that contains active ingredients which are incorporated into the polymer structure when KOROGARD wallcovering is manufactured. There is no single, generic antimicrobial additive. The additive is homogenously distributed throughout the matrix, enabling it to provide antimicrobial protection across the entire surface area and into the substrate. When microbes come in contact with a KOROGARD sheet that contains antimicrobial protection, the ingredient penetrates the cell wall, affecting the cell's ability to function, grow and reproduce.

The antimicrobial product in KOROGARD wallcovering is not OBPA (arsenic) or TBT (Tributyl tin) based. It is an organic based additive that proves to be the most effective, safe, and durable ingredient that will last for the life of the wallcovering itself. It is commonly found in toothpaste, hand soaps and many other household products.

How does antimicrobial protection work?

The additive is both broad spectrum bacteriostatic and fungistatic. A halogenated bisphenol, it affects the metabolic and biochemical processes of bacteria, mold and yeast. The active ingredient has been clinically documented to be effective against a non-comprehensive list of organisms.

Why is antimicrobial protection important?

In the healthcare industry, preventing the growth and spread of microbes — including odor and stain causing bacteria and fungi—can be particularly important. Antimicrobial protection is a distinct benefit in areas where cleanliness matters.

What does this mean to you?

Increased awareness of the need to manage microbes has made antimicrobial protection widely sought after. **KOROGARD 500 MB Protective Wallcovering** with antimicrobial protection (designated by the letters MB) slows the growth and spread of microbes making it easier to maintain the wallcovering's surface between cleanings for the useful life of the product.
